SGAP 2026

Agentic machine learning

From LLM to agent to harness. Then skore-skills for data science.

Guillaume Lemaître · Probabl

An LLM writes text. An agent acts.

The model

One call. It predicts the next tokens, then stops. It never sees whether its answer works.

The agent

The same model, called in a loop. It runs code, reads the output, and picks the next step until the task is done.

THE HARNESS

Everything around the model is the harness.

Model
DeepSeek, Claude, GPT...

+

Harness
Pi, Claude Code, Codex, Cursor...

=

Agent
What you actually work with

Tools

Shell, files, Python. What it can do.

Context

Instructions, project files, history. What it knows.

Skills

Packaged know-how, loaded on demand. How it should work.

Guardrails

Permissions and sandbox. What it may not do.

Same model, different harness: different results.

SKORE-SKILLS

A harness for data science.

Skills for your coding agent, built on scikit-learn experience. Bring your agent and your model.

01

Set up the project

Workspace, reproducible environment, Git.

02

Explore the data

Inspect tables, surface issues, write a report.

03

Build and evaluate

skrub and scikit-learn pipeline, evaluated with skore.

04

Iterate on ideas

Turn results into the next experiments.

```
$ pip install skore
$ skore skills install
```

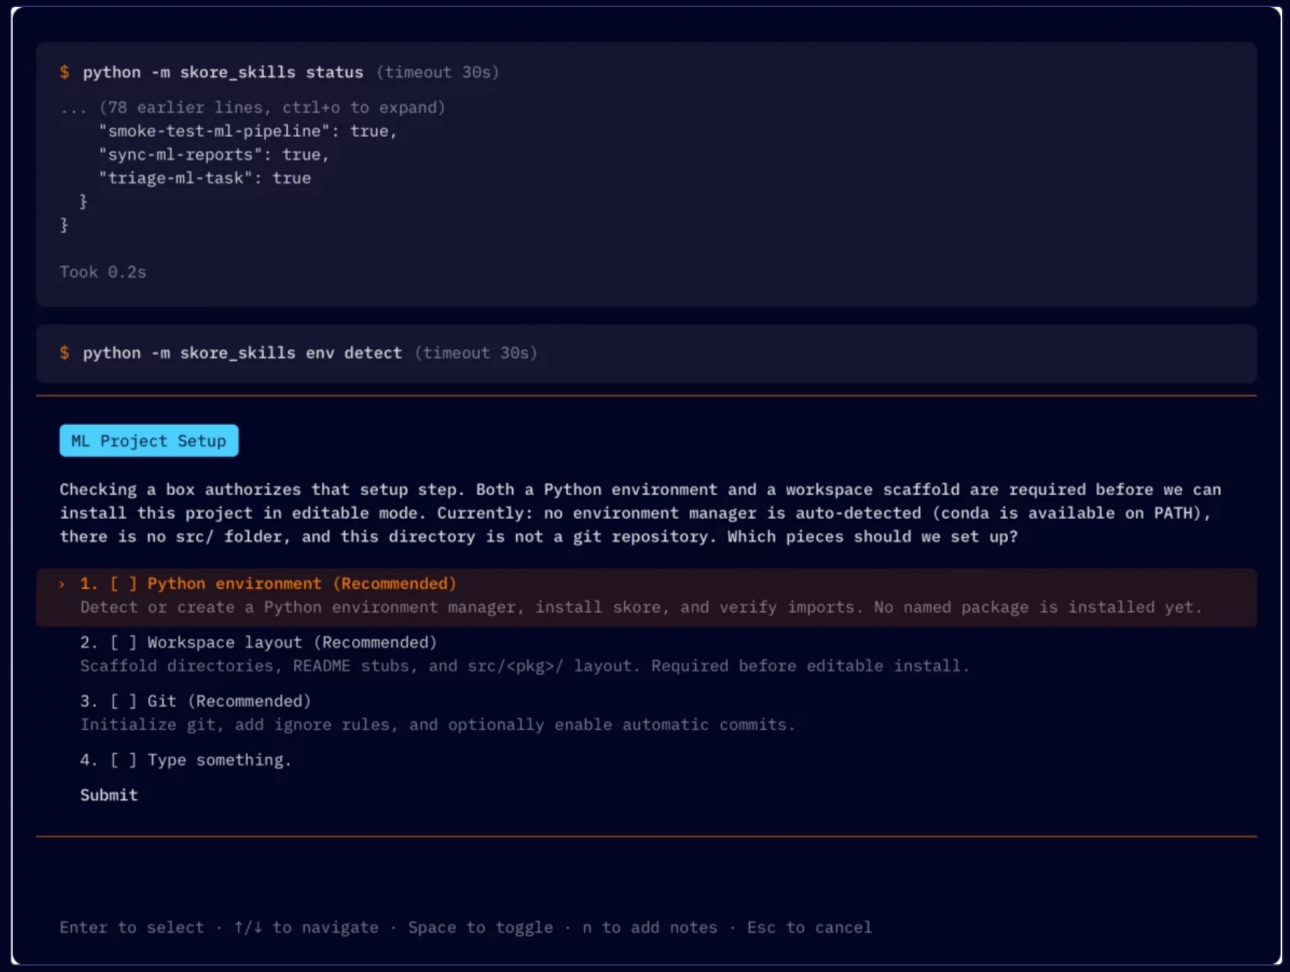

WORKS WITH YOUR HARNESS

Pi, opencode, Claude Code, Codex...

SKORE-SKILLS · 01

Set up the project

- Structured workspace for new experiments and production
- Dependencies and experiment history preserved with Git

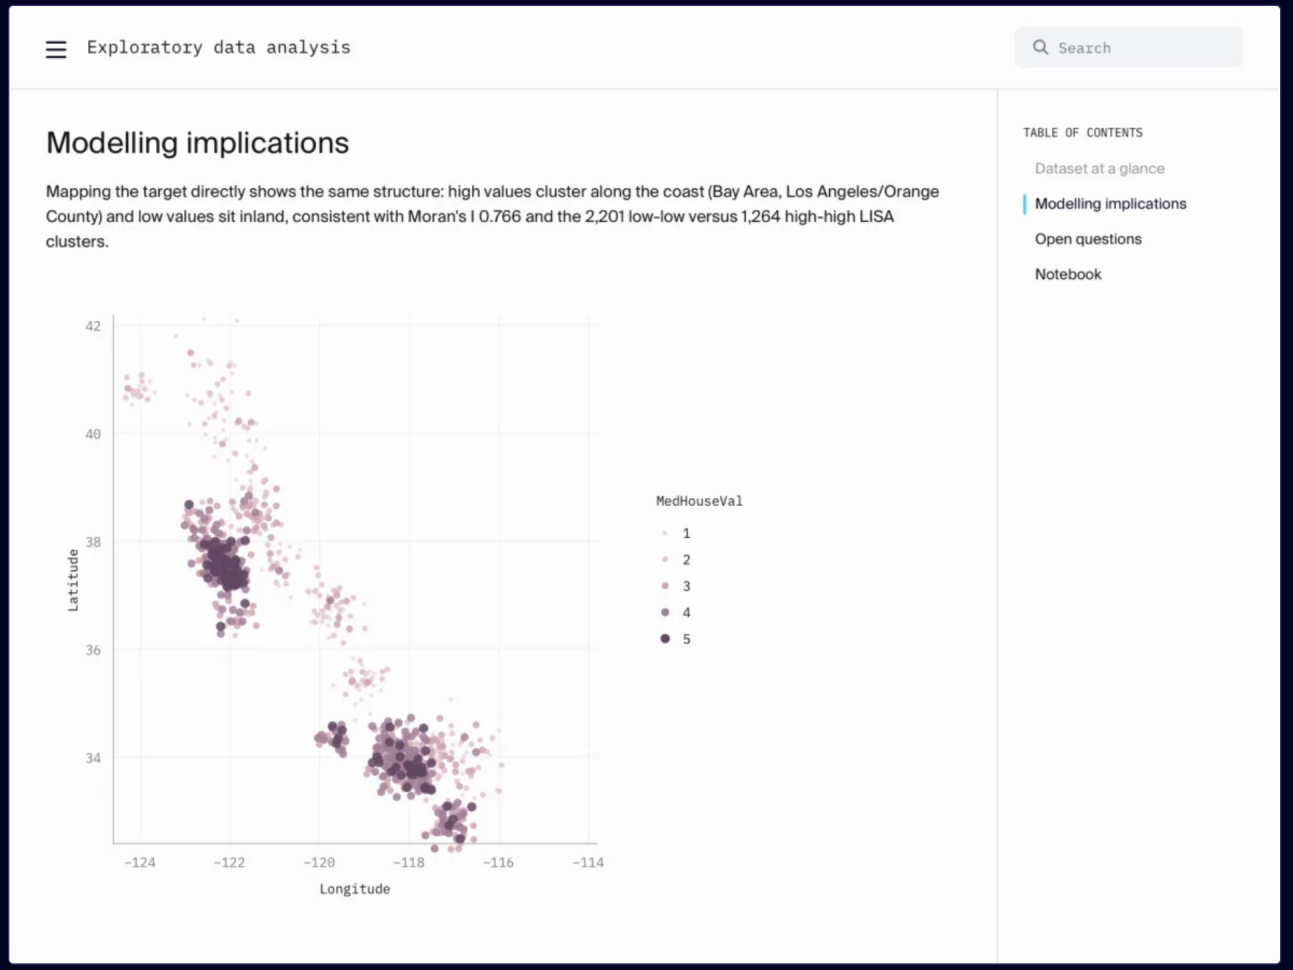

Screenshot: probabl.ai/skore-mcp

SKORE-SKILLS · 02

Explore the data

- Insights and data issues caught before any modeling
- A detailed report with code you can come back to

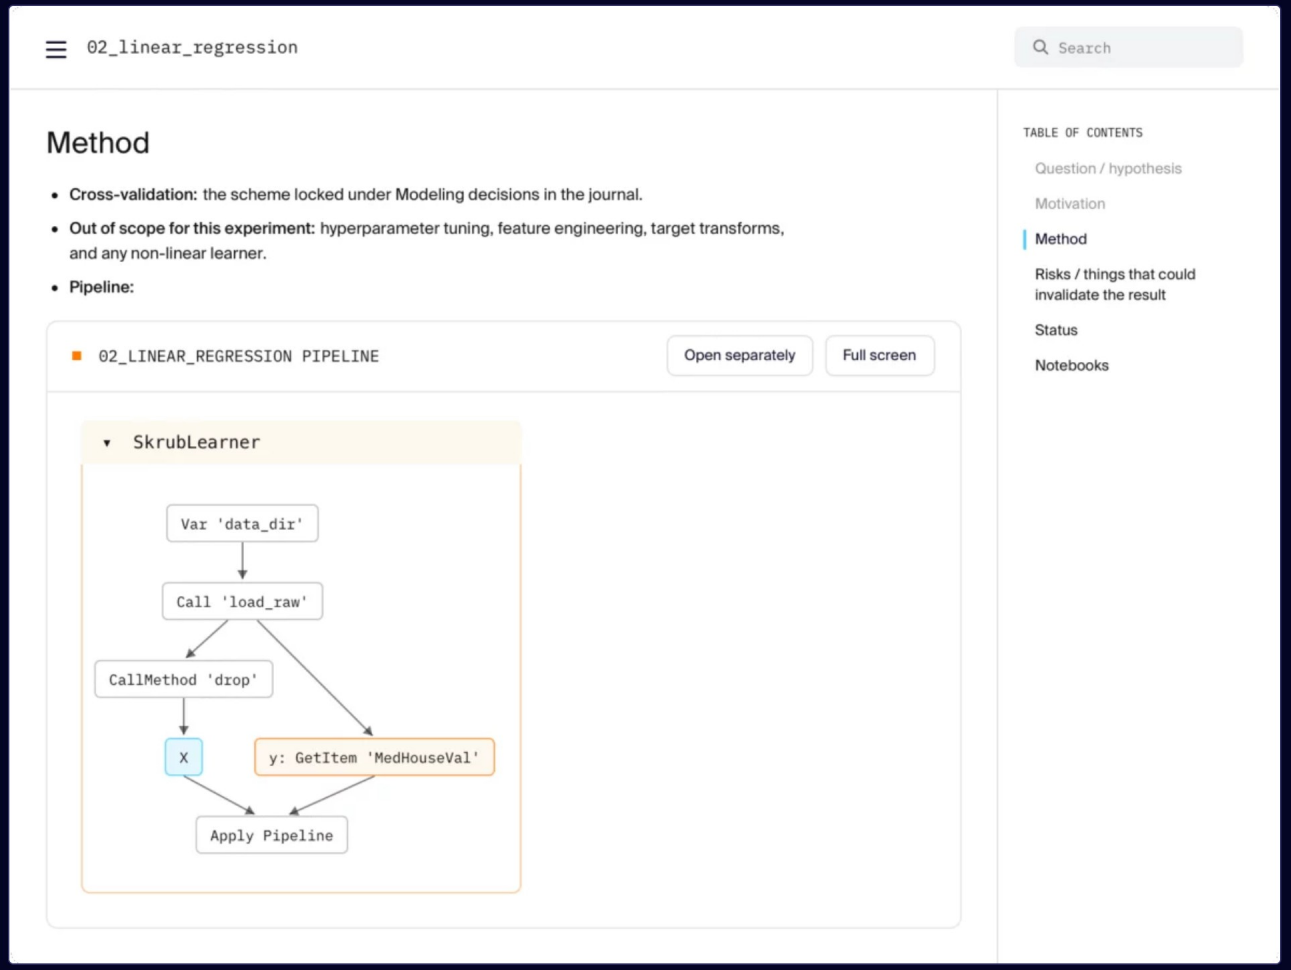

Screenshot: probabl.ai/skore-mcp

SKORE-SKILLS · 03

Build and evaluate models

- Any data source, one scikit-learn-compatible pipeline
- A skore report of metrics, checks, and insights

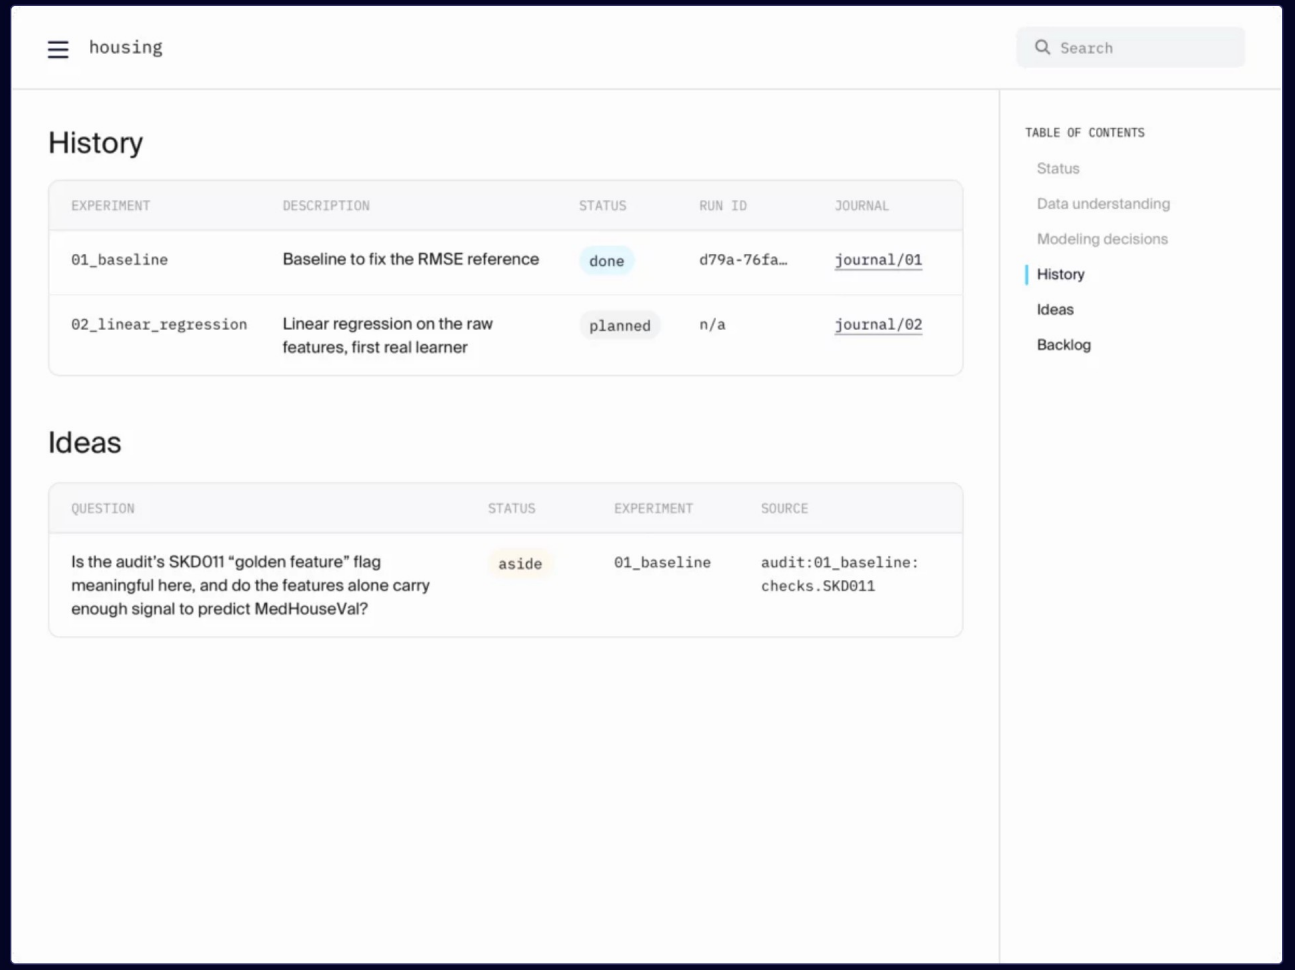

Screenshot: probabl.ai/skore-mcp

SKORE-SKILLS · 04

Iterate on new ideas

- Next steps drawn from the reports and the evaluation

- Literature research on what you know and could explore

Screenshot: probabl.ai/skore-mcp

HANDS ON

Your turn.

PROMPT YOUR AGENT

```
Explore the tephra data in data/ and build a machine learning
model.
```
